A.5 GENERAL PRELIMINARY NOTES / ALLGEMEINE BESCHREIBUNG

This report concerns a stage roof structure for Prolyte Products Group. The roof will be assembled in the size of 25x15 m. The total height of the ST-stage is 15,1m or 18,6m of the CT-stage.

The stage roof is considered to be a temporary demountable structure and not as a permanent building.

The whole structural-framework consisting of Aluminium trusses is made by the company Prolyte.

Geometry and allowable loads are shown in annex A.

The roof area is enclosed with canopy, Rear wall and sides can be closed with canopy or scrim walls. Two different arrangements are determined:

1. Roof, rear wall and sides are enclosed with 100% closed canopy.
2. Roof covered with 100% closed canopy, rear- and side walls are enclosed with 40% permeable scrim.

The Canopy is calculated to be 100% closed. The scrim walls are considered with a permeability of 40 %.

This means the aerodynamic coefficient of the scrim wall should not be greater than $0,6 \times 1,3 = 0,78$.

A manufacturer certification of aerodynamics is necessary.

(The specification of canvas permeability is not sufficient !)

The wall canopy is fixed at the horizontal roof trusses as well as to the base girders.

The structure is stiffened by means of guy wires in roof and rear- and sidewalls. Guy wires need to be adequately tensioned before use.

Above windforce 8 the canopy of the the rear- and sidewalls needs to be removed.

Additionally the roof girders have to be braced and one guy wire has to be added in the front.

Optionally Sidewings may be built-on.

Bei der vorliegenden Konstruktion handelt es sich um ein Bühnendach für die Firma Prolyte.

Das Dach wird in der Größe 25 x 15m aufgebaut. Die Höhe beträgt 15,1m (ST) bzw. 18,6m(CT).

Es handelt sich um eine Konstruktion die temporär errichtet wird und an verschiedenen Orten aufgebaut werden kann.

Die gesamte Konstruktion besteht aus Aluminium - Traversen der Firma Prolyte. Alle Traversen bestehen aus Aluminium AlMgSi1 F31 / EN AW 6082 T6. Geometrie und zulässige Belastung sind dem Anhang A zu entnehmen.

Die Dacheindeckung besteht aus wasserundurchlässigen Planen. Rück -und Seitenwände können mit Planen oder Gazen geschlossen werden. Es werden 2 Verplanungszustände betrachtet

1. Dach und Wände mit Planen geschlossen.
2. Dach mit Plane, Rück- und Seitenwände mit 40% durchlässiger Gaze geschlossen.

Planen werden zu 100% geschlossen gerechnet. Die Gazen werden mit einer Winddurchlässigkeit von 40 % zu Grunde gelegt. Das heißt die Gaze darf einen c_f - Wert von maximal $0,6 \times 1,3 = 0,78$ bei senkrechter Anströmung aufweisen. Es ist ein Zertifikat des Herstellers zur Winddurchlässigkeit erforderlich. (Die Angabe der Luftdurchlässigkeit eines Gewebes ist nicht ausreichend.)

Die Wandplanen/-gazen werden am Dach und an der Fußpunktverbindung befestigt.

Die Aussteifung des Systems erfolgt über Drahtseilverbände in Dach und Rück-und Seitenwänden. Die Verbände sind ausreichend vorzuspannen.

Ab Windstärke 8 werden die Rück- und Seitenplanen entfernt. Zusätzlich werden die Dachträger abgespannt und ein Seilkreuz in die vordere Wand eingebaut.

Optional können Sidewings aufgebaut werden.

A.6 LOADING ASSUMPTIONS / LASTANNAHMEN

General:

Before erection use and disassembling of the roof, weather reports should be gathered

Wind loading:

The construction is calculated to withstand wind forces up to 28 m/s. Above 20 m/s all rear- and side wall canopies need to be removed. Above windforce 8 the canopy of the the rear- and sidewalls needs to be removed. Additionally the roof girders have to be braced and one guy wire has to be added in the frontwall.

Applied wind pressure:

| | | |
|-----------------------|----------|-------------------------|
| Status in service | $h < 5m$ | 0,15 kN/m ² |
| | $h > 5m$ | 0,25 kN/m ² |
| Status out of service | $h < 8m$ | 0,44 kN/m ² |
| | $h > 8m$ | 0,625 kN/m ² |

according to DIN 13814 without the c_{tem} factor

Windlasten:

Die Konstruktion mit voll geschlossenen Planen für Rück- und Seitenwand ist bis Windstärke 8 standsicher. Ab Windstärke 8, bzw. ab Windgeschwindigkeiten größer 20 m/s sind die Wandplanen zu entfernen.

Die Konstruktion mit geschlossener Dachfläche und entfernter Rückwand- und Seitenplanen ist ohne Windstärkenbegrenzung standsicher.

Zusätzlich werden die Dachträger abgespannt und ein Seilkreuz in die vordere Wand eingebaut.

Angesetzte Staudrücke:

| | | |
|---------------------|----------|------------------------|
| Status Betrieb | $h < 5m$ | 0,15 kN/m ² |
| | $h > 5m$ | 0,25 kN/m ² |
| Status kein Betrieb | $h < 8m$ | 0,44 kN/m ² |
| | $h > 8m$ | 0,625 kNm ² |

in Anlehnung an DIN EN 13814 ohne den c_{tem} Faktor

V [m/s²] = v[km/h] / 3.6
Wind speed

q[kN/m²] = V² / 1600
Windpressure

- Snow loading:** **Snow loads are not taken into account!**
Erection of the structure shall only be made in appropriate weather conditions, or the roof shall be kept free from snow.
- Schneelasten:** Schneelasten kommen nicht zum Ansatz, da die Aufstellung nur bei entsprechender Witterung erfolgt, oder das Dach schneefrei gehalten wird.

Membrane tension due to wind: DIN 4112/A1, 5.17.3.4

By applying a dynamic loading $q=0.50 \text{ KN/m}^2$ with its aerodynamic coefficient $c_f = 0.40$ and regarding a span of $l=5.00 \text{ m}$ a resulting membrane tension of $Z=0.80 \text{ kN/m}$ is derived.

$$Z=(Z_y^2+Z_z^2)^{1/2}=0.80 \text{ kN/m with } Z_z=0.5*0.4*5.0/2=0.50 \text{ kN/m}$$

$$Z_y=(Z^2-Z_z^2)^{1/2}=(0.80^2-0.50^2)^{1/2}=0.624$$

$$Z_y/Z_z=0.624/0.50=1.25 = 1 / 0.8$$

Planenzug aus Wind: DIN 4112/A1, 5.17.3.4

Bei einem Staudruck $q=0.50 \text{ KN/m}^2$ mit einem aerodynamischen Beiwert $c_f = 0.40$ und $l=5.00 \text{ m}$ ergibt sich ein resultierender Planenzug $Z=0.80 \text{ kN/m}$

$$Z=(Z_y^2+Z_z^2)^{1/2}=0.80 \text{ kN/m mit } Z_z=0.5*0.4*5.0/2=0.50 \text{ kN/m}$$

$$Z_y=(Z^2-Z_z^2)^{1/2}=(0.80^2-0.50^2)^{1/2}=0.624$$

$$Z_y/Z_z=0.624/0.50=1.25 = 1/0.8$$

A.7 PERMISSIBLE LOADING / ZULÄSSIGE NUTZLASTEN

On following pages allowable pay loads of the structure and different possible configurations for equipment such as illumination(spots) and sounding are displayed. If the preparing loading configuration differ from these set up`s, please inform Prolyte or the Engineering office Krasenbrink+Bastians.

Loads up to 100 kg can be fastened at any position of the chord. Loads more than 100 kg have to be positioned at the node or adequate proofs have to be carried out. Loads shall be equally distributed over the trusses main chords.

All given values are static loads. To consider dynamic affecting the loads have to be decreased with a factor of minimum 1,2.

In die Dachkonstruktion werden Lasten aus Beleuchtung und Beschallung eingebracht.

Auf den folgenden Seiten werden verschiedene Lastkonfigurationen gezeigt. Weicht die tatsächliche Lastsituation erheblich von den gezeigten ab, ist Rücksprache mit dem Büro Krasenbrink+Bastians zu nehmen.

Lasten bis 100 kg können am freien Untergurt befestigt werden.

Lasten über 100 kg sind in den Knoten einzuhängen oder es sind entsprechende Nachweise zu bringen.

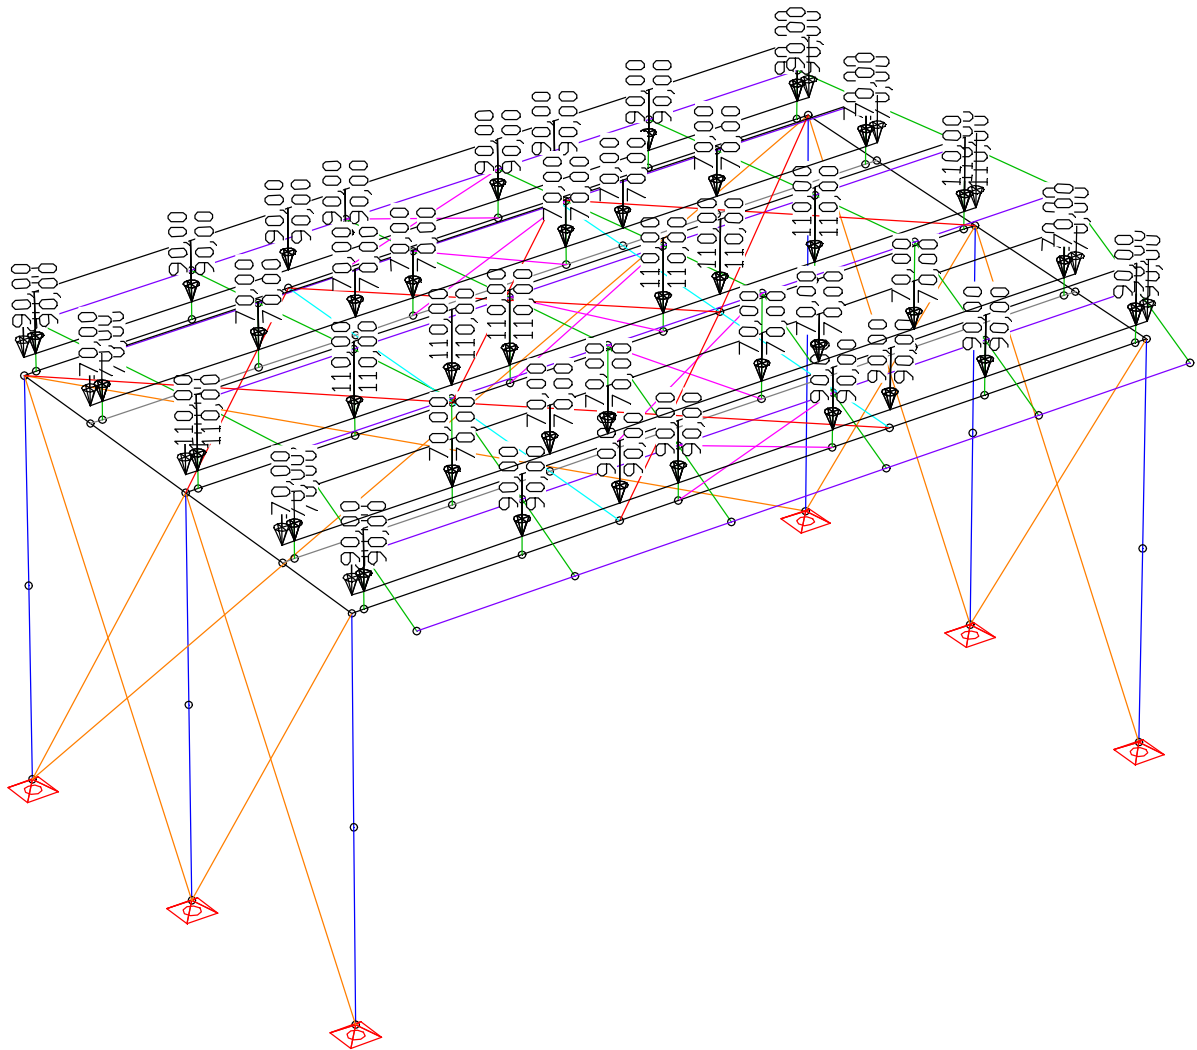

Alle Angaben sind statische Lasten. Werden die Lasten verfahren, ist ein dynamischer Lasterhöhungsfaktor von mindestens 1,2 zu berücksichtigen.

Die Angegebenen Lasten sind also mit 1/1,2 abzumindern.

[kg]**

A.8 NECESSARY BALLAST LOADING / ERFORDERLICHE AUFLASTEN

canopy arrangements / Verplanungs Zustände:

- | | |
|--|---------------------------|
| 1. roof, back wall and sides enclosed: | fully closed canvas wall |
| 1. Dach, Rück- und Seitenwände verplant: | windundurchlässige Planen |
| 2. roof, back wall and sides enclosed: | canvas wall 40% permeable |
| 2. Dach, Rück- und Seitenwände verplant: | Planen 40% durchlässig |
| 3. roof enclosed, back wall and sides removed | |
| 3. Dach verplant, Rück- und Seitenwände entfernt | |

preliminary remark / Vorbemerkung:

Suspended loads in the roof and interlocking connected podium may be taken into account of the ballast loading calculation.

Ständig ins Dach eingehängte Lasten oder kraftschlüssig angeschlossene Podeste können auf die Auflasten angerechnet werden.

frictional coefficient/Reibungsbeiwert

0,40 (steel to wood to stone/concrete, Stahl auf Holz auf Stein/Beton)

0,60 (steel to rubber to stone/concrete, Stahl auf Gummi auf Holz auf Stein/Beton)
